

Energy Mix[®]

Complementary feed for pigs

Energy Mix[®] contains high amounts of starch and sugars originated from surplus foods from the biscuits, confectionary and breakfast cereals industry.

Energy Mix[®] is also very rich in oil and fats derived from the snacks and chocolate industry. All ingredients are collected from food factories under a strict quality control system and are blended, ground and sieved to make a free flowing meal.

At the weaning stage piglets face a host of stressors such as:

- Health challenges
- Management changes
- Diet changes
- Changing environmental conditions

The result is: decreased feed intake – poor digestion – reduced utilization of nutrients. All of the above factors adversely affect the health of the gastrointestinal tract and reduce performance.

Energy Mix[®] contains an ideal combination of heat processed ingredients of high energy value and natural sweeteners. They contribute to increased feed intake and digestibility and enhance gastrointestinal health.

Advantages

- Increase palatability
- Increase feed intake at the delicate stage of weaning
- Improve nutrients utilization
- Improve FCR and growth rate

Components

- Products from the confectionary industry
- Products from the bakery and pasta industry
- Products from the pastry industry
- Products and by-products from the savoury snacks industry
- Products of the breakfast cereal manufacture
- Rice flour and Wheat middlings

Typical analysis

Dry matter	90%	Starch	42,6%	NE sows	13,4 Mj / Kg
Total Protein	10%	Sugars	11,5%	Calcium	0,10%
Total Fat	12,5%	NE pigs	13,2 Mj / Kg	Sodium	0,35%

Inclusion

- Suckling and weaned piglets up to 25% of total ration.
- Growing and finishing pigs up to 15% of total ration.
- Lactating sows up to 25% of total ration
